Use Katagon for control of tough grasses and broadleaves while promoting greater yield potential and profitability without glyphosate in the tank.

**A novel premix**
Katagon uses two active ingredients, tolpyralate and nicosulfuron, to deliver a winning combination in broad spectrum grass and broadleaf control in post applications. Katagon effectively targets glyphosate-, PPO-, triazine- and ALS-resistant weed species without glyphosate in the tank mix.

**Diminish tough weeds**
A first-of-its-kind HPPD premix herbicide, Katagon offers a wide application window and can be applied to field corn up to 20-inches tall or V5 (whichever is more restrictive) for greater weed control.

**“Within 24 hours weeds were noticeably diminishing, and by one week post-application they were virtually non-existent. The flexibility and effectiveness of Katagon on both broadleaf and grass weeds far surpassed my expectations.”**
– Jim Lange, Wisconsin

**CONSIDER WEEDS HANDLED WITH KATAGON®**
Katagon is a powerful postemergence herbicide strong enough to stand up against resistant weeds, while giving you greater flexibility across different types of field corn.

**WHY KATAGON?**
- Can be used on different types of corn – field, seed or silage
- Provides grass control without the addition of glyphosate
- Low use rates, at 3.2 fl oz/A
- Collaborative tank mix partner
Two-Pass Solution:

1 Refer to label for specific soil types and rates
2 Always use a methylated seed oil (MSO), crop oil concentrate (COC), or a nonionic surfactant (NIS) when applying Katagon to avoid reduced performance
3 In a tank mix with Katagon, the maximum single application rate for atrazine is 2.0 pounds per acre. Do not exceed 2.5 pounds of atrazine per acre per year
4 Post only: In fields with heavy giant ragweed, add Status or another auxin product, as appropriate.

MSO has been observed to provide the most consistent performance over a wide range of environmental conditions. MSO and COC can be applied at a concentration of 0.5 and 1% v/v (0.5 and 1 gallon per 100 gallon of spray volume), respectively, of the final spray volume. NIS can be applied at a concentration equal to 0.25% v/v (2 pints per 100 gallon of spray volume) of the final spray volume.

Katagon is powerful enough to use in a one-pass postemergence program, especially when using atrazine to supplement control. If tough-to-manage weeds or resistant weed species are present, use Katagon as part of a two-pass sequential weed control program.

Champion your tank mix with Katagon

The following combinations are effective options to control broadleaves and grasses in your postemergence programs.
